DETAILED ACTION

Election/Restrictions

Applicant's election with traverse of claim 1 in the reply filed on 23 January 2007 is acknowledged. The traversal is on the ground(s) that a search for the elected for the elected invention would necessarily entail a search for the non-elected invention. This is not found persuasive because the specifics to examine a process, namely the stepwise claim limitations, are not required when examining an apparatus, which is limited only by structural limitations. Although a process claim may contain apparatus limitations, they are only given patentable weight as to how the structure effects the stepwise process. Similarly, the specifics of an apparatus do not require the same consideration of stepwise process limitations as in a process claim but rather only that the structure is capable of performing such process step.

The requirement is still deemed proper and is therefore made FINAL.

Claims 2-7 are withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to a nonelected apparatus, there being no allowable generic or linking claim. Applicant timely traversed the restriction (election) requirement in the reply filed on 23 January 2007.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –
(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by Vetrini (WO 99/54118). Regarding Claim 1, Vetrini shows that it is known to carry

out a method of molding a polarizing film (Abstract) comprising the steps of applying a colored polarizing film to a molding face of a mold and allowing the polarizing film to be sucked onto the molding face by a vacuum suction to mold a colored concave and convex polarizing film (Page 12, lines 7-15), setting a tensile of the polarizing film in a certain direction to be smaller than a tension of the polarizing film in a direction perpendicular to the certain direction (Page 11, lines 6-8), and allowing a stretch of the polarizing film at a position on a line of the diameter of the mold to be smaller than a stretch thereof at other positions, thereby allowing color of the polarizing film at the position, where the stretch of the polarizing film is small, partially deep, so that the deep colored portion of the polarizing film forms a reference mark in a polarizing direction (Page 6, lines 6-13; reference mark=black crossing; it is being interpreted that stretch will implicitly happen due to the tension forces applied to the film).
